EPIDEMIOLOGY OF ACUTE HEPATITIS B NINETEEN YEARS AFTER THE INTRODUCTION OF UNIVERSAL VACCINATION IN PREADOLESCENTS IN CATALONIA, SPAIN

Angela Dominguez, Gloria Carmona, Inma Crespo, Nuria Soldevila, Joan Batalla, Luis Urbiztondo, Manel Oviedo and Luis Salleras
BACKGROUND

Prevaccination era → Hepatitis B: a major problem
1984 Vaccination of risk groups
HEPATITIS B: RISK GROUPS RECOMMENDED FOR VACCINATION (1984)

- Newborns of HBsAg-positive mothers
- Healthcare workers
- Developmentally disabled persons in long-term facilities
- Hemodialysis patients
- Men who have sex with men
- Promiscuous heterosexuals
- Household contacts and sexual partners of HBsAg(+) individuals
- Injection-drug users
- Incarcerated persons
- Travelers to HBV-endemic regions
- Patients with chronic liver diseases
- Patients in transplant programs
- Persons with HIV infection
BACKGROUND

Prevaccination era → Hepatitis B a major problem

End of the 1980s → No reliable data on incidence of hepatitis B (all cases of viral hepatitis reported jointly)

→ 1% of population: chronic HBsAg carriers (intermediate pattern)
Prevalence of markers of infection in a representative sample of the population. Catalonia, 1989

Department of Health
Generalitat of Catalonia

SIBEREP
1984 Vaccination of risk groups

1990 Advisory Committee on Immunizations of Department of Health recommended universal vaccination of preadolescents
RATIONALE FOR HEPATITIS B UNIVERSAL VACCINATION OF PREADOLESCENTS

- Limited impact of selective vaccination of risk groups
- Immediate impact of universal vaccination on clinical cases
- Potential of mass vaccination to eliminate the disease
- Well-established vaccination program in schools
RECOMMENDATIONS FOR HEPATITIS B VACCINATION IN CATALONIA

1984 Vaccination of risk groups

1991 Universal vaccination of preadolescents with 3 doses (0-1-6 months)
REPORTED HEP B IMMUNIZATION COVERAGES (THREE DOSES). CATALONIA, 1992-2010
Prevalence of hepatitis B vaccine-induced immunity in adolescents aged 14 years in Catalonia

Salleras et al. Vacunas 2000; 1:3-6

* AntiHBs (+) and AntiHBc (-)

* Induced vaccine immunity*  Reported vaccine coverage

Salleras et al. Vacunas 2000; 1:3-6
OBJECTIVE

To analyze the evolution of reported cases of acute hepatitis B in Catalonia from 1991 to 2010
METHODS (I)

✓ **Clinical case definition** ➔ An acute illness with a discrete onset of symptoms and:
  - jaundice, or
  - elevated serum aminotransferase levels

✓ **Laboratory confirmation** ➔ Detection of IgM to hepatitis B core antigen (anti-HBc)

or

→ Hepatitis B surface antigen (HBsAg) positive and negativity for markers of other hepatitis viruses
METHODS (II)

For each reported case, the following variables were collected:
- Year
- Age
- Sex

For each year: the incidence rate in the whole population and in the 10-19 years age group, vaccine coverage of adolescents and the proportion of immigrants.

Incidence rates and rate ratios (with 95% CI) for every year and for five-year periods compared to 1991.
METHODS (III)

To evaluate trends of incidence rates:
- Pearson’s correlation coefficient
- Spearman’s correlation coefficient
were calculated

Statistical significance was established assuming an alpha error of 0.05
RESULTS
EVOLUTION OF REPORTED VIRAL HEPATITIS. CATALONIA, 1991-2010

Hep B vaccination of preadolescents

Hep B vaccination of infants

Number of cases

Hepatitis A  Hepatitis B  Other viral hepatitis

CONCLUSIONS

1. The reported incidence of acute hepatitis B (AHB) has fallen by 48% in the whole population nineteen years after the introduction of universal vaccination of preadolescents. The decrease was greater (61%) between 1991 and 2001.

2. In the 10-19 years age group, corresponding to vaccinated cohorts, the reduction after nineteen years of vaccination is 81%. The greatest reduction was observed between the years 1991 and 2001: 100% in males and 74.2% in females.
CONCLUSIONS

3. Although the reported incidence of AHB has fallen nineteen years after the introduction of universal vaccination of preadolescents, no reduction has been observed since 2001 in the whole population or in the 10-19 years age group.

4. Between 2002 and 2010, the percentage of immigrants increased by 171% in the whole population, 161% in the 10-19 years age groups and 196% in the 10-19 years old males. This may explain why the impact of universal vaccination of preadolescents has been suboptimal.
RECOMMENDATIONS

✓ Specific activities targeting the vaccination of immigrants should be implemented to improve the impact of hepatitis B vaccination in the community.

✓ Special efforts should be directed to immigrants coming from countries where mass vaccination programmes have still not been launched or where the coverage is still very low.
